Summary of Admissions Variables and College Grade Data

This table summarizes the admissions variables used to predict college success at your institution. The table shows number of students, mean value, and standard deviation. This information is provided for:

- 2015 high school graduates who sent ACT scores to your institution
- FEMALES who completed the year at your institution
- FEMALES with core course preparation in high school
- FEMALES without core course preparation in high school

The table includes only those students who had valid data for the admissions variables. The table also summarizes the college GPAs earned by your FEMALES. The information in this table can be used to compare the different groups. Note: Some students may be missing high school GPA and/or core status.

Mean ACT Score and High School GPA, by College GPA Categories

This table summarizes the admissions variables of your FEMALES by categories of college GPA. The table shows number of students, mean value, and standard deviation in five GPA categories.

The information in this table gives a rough impression of the relationship between students' admissions variables and their college GPA. The mean values of useful admissions variables should increase as college GPA increases.

ACT Norms for FEMALES at Your Institution

This table reports the number of students at each ACT score and the percentage at or below each score for the four ACT tests and the Composite score.

The total number of students and ACT score means and standard deviations also are listed.

Chance of a B or Higher College GPA, Given ACT composite score and High School GPA

The matrix reports students' chances of achieving a B or higher at your institution, given their ACT composite score and High School GPA. For example, the chance that a student with an ACT composite score of 25 and a High School GPA of 3.5 would obtain a B or higher is 75%.

If present, the dark gold area shows the combinations of ACT composite score and High School GPA values that are at or near a 50% chance level. The combinations that maximize the percentage of correct admissions decisions (accuracy rate) always correspond to a chance of 50%.

ACT composite score

Chance of a C or Higher College GPA, Given ACT composite score and High School GPA

The matrix reports students' chances of achieving a C or higher at your institution, given their ACT composite score and High School GPA. For example, the chance that a student with an ACT composite score of 25 and a High School GPA of 3.5 would obtain a C or higher is 94%.

If present, the dark gold area shows the combinations of ACT composite score and High School GPA values that are at or near a 50% chance level. The combinations that maximize the percentage of correct admissions decisions (accuracy rate) always correspond to a chance of 50%.

ACT composite score

Admissions Information for ACT composite score and High School GPA

This table shows the effects of using different admissions policies. For example, if you were to require students to have at least a 50% chance of a B or higher for admission, then you would expect:

- about 27% of your students would not be admitted
- about 69% of your admissions decisions would be correct
- about 71% of those admitted would obtain a B or higher

	B or higher			C or higher		
Chance range	Percent below	Accuracy rate	Success rate	Percent below	Accuracy rate	Success rate

If present, the shaded rows highlight the optimal cutoff combinations (i.e., those that lead to the highest percentage of correct admissions decisions).

The first graph reports students' chances of achieving a B / C or higher at your institution, given just their ACT composite score. For example, the chance that a student with an ACT composite score of 21 would obtain a B or higher at your institution is 62%.

The second graph reports students' chances of achieving a B / C or higher at your institution, given just their High School GPA. For example, the chance that a student with a High School GPA of 2.89 would obtain a B or higher at your institution is 43%.

Note: The chances of success for one or both criteria are all above or below 50%. No optimal cutoff score exists.

Logistic Regression Weights and Correlations

This table contains the estimated logistic regression weights used to calculate the chances of success. The weights associated with the ACT composite score and high school GPA are shown with the corresponding significance level (p-value). This information can be used to calculate the chances of success for a given student.

A p-value is an estimate of the probability that a regression weight of magnitude equal to that reported in the table would occur by chance if the true regression weight were 0; the smaller the p-value, the more highly "statistically significant" the regression weight is. The correlation between the admissions variables and college GPA also is listed.
